Education

B.S. Theoretical Physics

State University of New York at Fredonia

Aug 2019 - May 2023

GPA: 3.7

Relevant coursework: multivariable calculus, linear algebra, probability & statistics, machine learning, data structures, object oriented programming

Skills

- Python (NumPy, Pandas, PyTorch, TensorFlow, Keras, Matplotlib, Seaborn, Jupyter)
- SQL (MySQL, BigQuery)
- Git
- Linux
- Cloud Computing (GCP)
- Machine Learning
- NLP

Experience

2021 - 2022

Berkeley SETI Research Center, UC Berkeley — *Berkeley, CA*

Research Assistant

Q: The search for extraterrestrial intelligence is often limited by local interference

- Scraped and cleaned 95,000 radio observations using **BigQuery**
- Developed a modified **Transformer** BERT model in **PyTorch**
- Parallelized training across 16 GPUs on a **GCP** VM instance
- Achieved 89.66% classification accuracy using **k-fold cross-validation**

2019 - present

Department of Physics, SUNY Fredonia — *Fredonia, NY*

Undergraduate Researcher

Q: Protostellar astronomy typically requires multi-wavelength observations

- Physically simulated protostellar systems using **radiative transfer models**
- Derived a linear correlation (**correlation coefficient** 0.95) at 73.6 microns
- Demonstrated that a single observation at millimeter wavelengths is statistically sufficient, and provided a framework for computing uncertainties
- Cut down observing time by 190 hours, and observing costs by $390,000 (per target object)

Q: Multiple competing hypotheses exist for a rare stellar phenomenon

- Synthesized 100 distinct observations of a target star into a continuum image
- Designed custom **Python** scripts to enhance image quality by a factor of 248
- Implemented **API shell scripts** to extract a stellar disk mass of 0.024 solar masses, implying a disk-to-star mass ratio of 5%
- Interpreted our results to be in direct contradiction with several existing hypotheses, narrowing down the possible explanation space by ~20%

Q: CCD cameras become inaccurate when oversaturated at long exposure times

- Outlined a procedure to acquire 30 images at varying exposure times
- Established a baseline for image quality using the data at low exposures
- Applied **linear regression** to extrapolate the baseline out to higher exposures
- Determined an optimal correction factor of 0.1% to 1.8% using **polynomial regression**, with a **reduced-chi squared** value of 0.309

Projects

- **Recommendation Engine**: Scraped data using the myanimelist.net API. Developed a pairwise similarity recommendation framework with **NumPy** and **Pandas**. Optimized performance for chained queries.
